TLP:WHITE — PORTFOLIO VERSION — PRIVATE INVESTIGATION — OSINT / PUBLIC SOURCES ONLY

CASE-2026-MOB-001

Mobile Number OSINT Investigation

Target Phone Intelligence | Multi-Platform Pivot | Identity Attribution | Social Media Mapping

A structured open-source intelligence investigation starting from a single target mobile number — pivoting through Truecaller, WhatsApp, Facebook, and Instagram to identify associated identities, secondary contact numbers, and a suspected individual operating multiple fraudulent digital service channels. Conducted as an independent private investigation exercise.

REPORT ID	CASE-2026-MOB-001	**DATE**	29 January 2026
INVESTIGATOR	Dharam Kathiriya	**INVESTIGATION TYPE**	Private / Independent
TARGET SEED	[REDACTED] — Mobile number, India	**CATEGORY**	Phone OSINT / Social Pivot
TLP	WHITE — Portfolio version	**STATUS**	CLOSED / INVESTIGATION COMPLETE

IMPORTANT — REDACTION NOTICE

All mobile numbers, personal names, email addresses, profile photos, and identifying details have been redacted or blurred in this portfolio version. This is a private investigation conducted independently for skill development purposes. No unauthorized access was used — all information sourced from publicly available platforms. Full unredacted documentation exists in a private case archive.

01 | EXECUTIVE SUMMARY

Objective: Conduct a full mobile number OSINT investigation starting from a single target phone number. Identify the owner, map linked social media accounts, extract associated contact numbers from public posts, investigate all discovered numbers, and reconstruct the subject's digital footprint to assess whether suspicious or fraudulent activity can be confirmed.

KEY INVESTIGATION FINDINGS

Seed number confirmed active: Target number verified via Truecaller bot — registered in Rajasthan state, India; WhatsApp account confirmed active

Owner profile: Number attributed to an individual operating what appears to be a YouTube service promotion business — identity redacted in portfolio version

Facebook profile identified: WhatsApp pivot yielded a linked Facebook profile with publicly accessible reels and contact information

3 secondary numbers extracted: Three additional mobile numbers discovered in public reel comments on the Facebook profile

Secondary number attribution: All 3 secondary numbers investigated — owners identified: [REDACTED-1], [REDACTED-2] (with linked Gmail), and [REDACTED-3]

Location intelligence: Google reverse image search on Facebook background/reel imagery identified matching Instagram accounts suggesting a geographic cluster in Rajasthan

Suspected key subject: One individual ('Nitin' — name shown in Instagram profile) suspected as primary operator; identity under continued assessment

Fraud indicators: Operation consistent with paid YouTube service promotion scheme — potential digital fraud indicators identified for further investigation

02 | INVESTIGATION METHODOLOGY

2.1 OSINT framework applied

This investigation followed a structured mobile number OSINT methodology — starting from the phone number as the sole seed data point and expanding outward via platform pivots, username searches, and image intelligence.

PHASE	ACTION	TOOLS	OUTCOME
1 — Seed validation	Google dorking on target number	Google Advanced Search	No direct results — number not publicly indexed
2 — Carrier & owner	Truecaller lookup via Telegram bot	Truecaller Bot (Telegram)	State: Rajasthan | WhatsApp confirmed | Owner category identified
3 — Social pivot	WhatsApp link → Facebook profile	WhatsApp OSINT, Facebook public search	Active Facebook profile found with public reels
4 — Secondary number extraction	Scrape public reel comments for contact numbers	Manual OSINT — Facebook comment analysis	3 mobile numbers extracted from public comments
5 — Number investigation	Truecaller + HLR lookup on 3 secondary numbers	Truecaller, NumLookup, HLR Lookup	Owners, emails, and carriers attributed for all 3
6 — Image intelligence (IMINT)	Reverse image search on profile/reel background images	Google Reverse Image Search	5 matching Instagram accounts found in same geographic region
7 — Subject attribution	Cross-reference all findings to identify primary suspect	Manual correlation, pattern analysis	One primary suspected individual identified ('Nitin' alias — assessment ongoing)

2.2 Tools used

TOOL	PURPOSE	RESULT IN THIS INVESTIGATION
Google Dorking	Initial number search across public web	No direct hits — number not indexed publicly
Truecaller (Telegram Bot)	Phone number owner identification	Owner name, state, carrier, WhatsApp status
Facebook (passive OSINT)	Social profile identification and content analysis	Active profile found; public reels with comment data
NumLookup / HLR Lookup	Carrier, location, and line type identification	Carrier and region confirmed for all 4 numbers
Google Reverse Image Search	IMINT — match profile/background images to other sources	5 Instagram accounts identified with matching imagery
Manual comment scraping	Extract contact numbers from public post comments	3 secondary numbers discovered
Truecaller (web + bot)	Secondary number owner attribution	3 owners identified with names and one with linked email

03 | TARGET NUMBER — PRIMARY INVESTIGATION

SEED DATA POINT
Target mobile number: [REDACTED] | Country: India | Investigation start: 29 January 2026, 14:00 IST

3.1 Phase 1 — Google dorking

Method: Advanced Google search operators applied to the target number: "7XXXXXXXX" site:facebook.com, "7XXXXXXXX" site:instagram.com, "7XXXXXXXX" contact OR "call us", intitle:"7XXXXXXXX".

Result: No direct results returned. The number was not publicly indexed on any major platform or directory via Google. This indicates either deliberate privacy settings, number not used in web-visible content, or recent registration. Escalated to Truecaller lookup.

GOOGLE DORKING QUERIES APPLIED
"[TARGET NUMBER]" site:facebook.com
"[TARGET NUMBER]" site:instagram.com
"[TARGET NUMBER]" site:justdial.com OR site:sulekha.com
"[TARGET NUMBER]" contact OR WhatsApp OR call
intitle:"[TARGET NUMBER]"
Result: Zero results across all query variants — number not publicly indexed

3.2 Phase 2 — Truecaller investigation

Method: Target number submitted to Truecaller via automated Telegram bot (@TrueCaller_Robot). Truecaller aggregates caller ID data from crowdsourced user reports and app usage patterns across India.

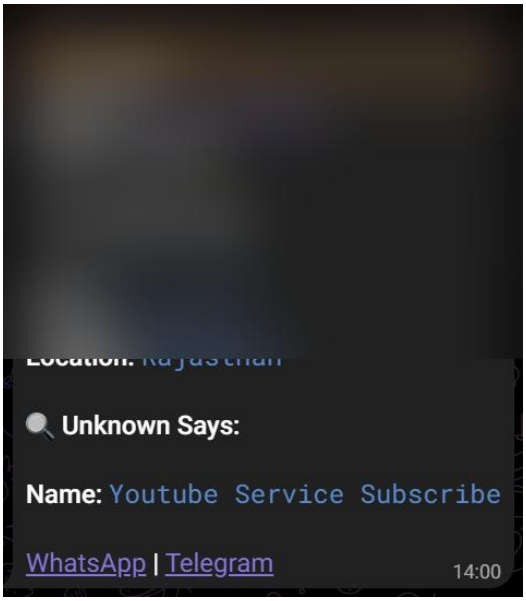

Figure 3.1 — Truecaller bot result for target number. Owner name, carrier, and state redacted. WhatsApp icon confirmed active account.

Truecaller findings:

NUMBER	[REDACTED]
OWNER NAME	[REDACTED — private name withheld]
STATE	Rajasthan, India
CARRIER	[REDACTED]
WHATSAPP STATUS	Active WhatsApp account confirmed
ACCOUNT TYPE	Individual — operating YouTube service promotion channel
SPAM REPORTS	Not flagged as spam in Truecaller database at time of investigation

3.3 Phase 3 — WhatsApp to Facebook pivot

Method: WhatsApp account confirmed active — this provides a pivot opportunity. Target number submitted as Facebook friend suggestion lookup. Facebook links mobile numbers to accounts when privacy settings permit. Active Facebook profile identified.

Significance: WhatsApp-to-Facebook pivot is a high-value OSINT technique in the Indian context, as both platforms share the same parent company (Meta) and users frequently link the same number across both. This pivot succeeds when the target has not restricted account discoverability by phone number.

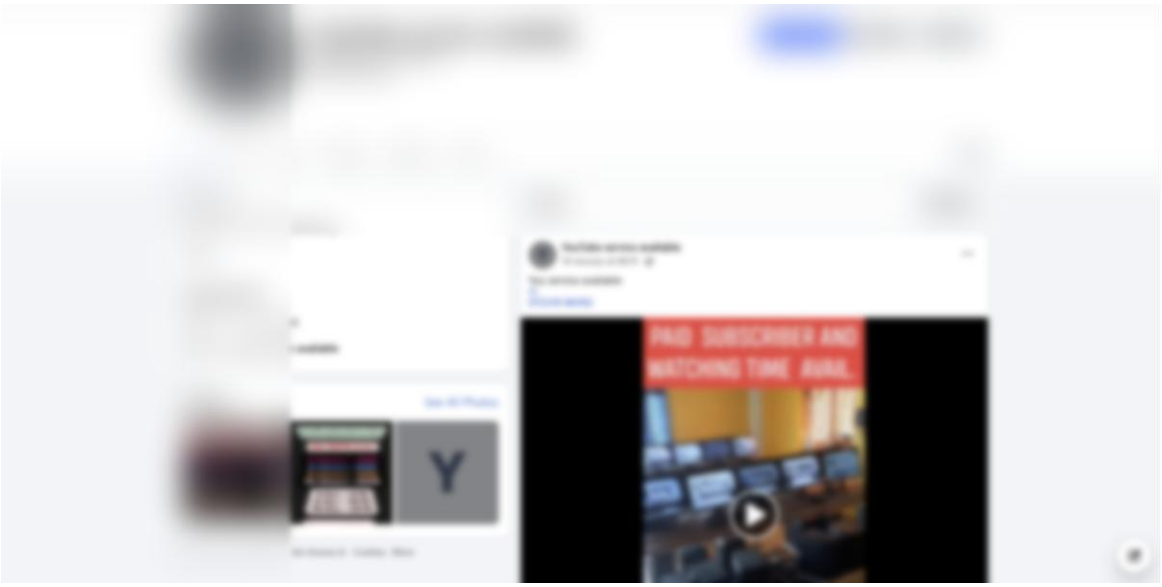

Figure 3.2 — Facebook profile identified via WhatsApp pivot on target number. Name, profile photo, and personal details redacted.

Facebook profile findings:

- **Profile status:** Public — reels, posts, and comments visible without authentication
- **Content type:** YouTube service promotion content — offering subscriber growth, view count, and engagement services
- **Location signals:** Rajasthan region consistent with Truecaller state attribution
- **Activity level:** Active account — recent posts with engagement; comment sections contain third-party contact numbers
- **Key OSINT value:** Public reel comments contained mobile numbers posted by associates/customers — critical pivot for secondary investigation

04 | SECONDARY NUMBER EXTRACTION & INVESTIGATION

Method: Manual analysis of public Facebook reel comments on the target's profile yielded three additional mobile numbers posted openly by associated individuals. Each number was subsequently investigated using Truecaller, HLR lookup, and NumLookup.

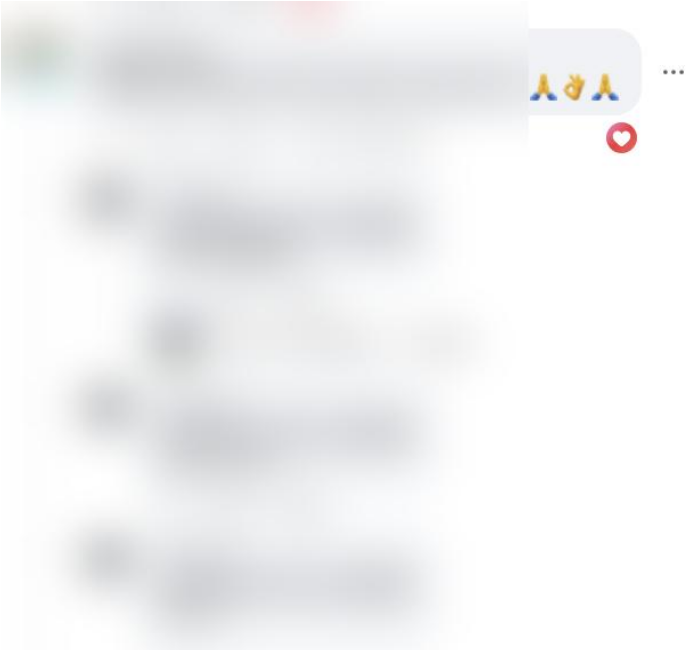

Figure 4.1 — Facebook reel comment section showing publicly posted mobile numbers. Numbers and names redacted in portfolio version.

SECONDARY NUMBERS DISCOVERED

Number A: [REDACTED] — extracted from reel comment
Number B: [REDACTED] — extracted from reel comment
Number C: [REDACTED] — extracted from reel comment

4.1 Number A — investigation

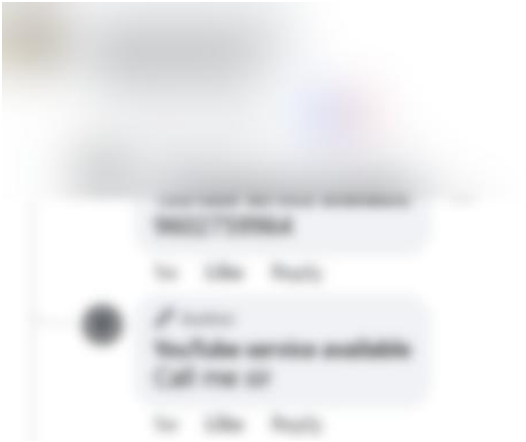

Figure 4.2 — Truecaller result for Number A. All PII redacted.

NUMBER	[REDACTED — Number A]
OWNER NAME	[REDACTED]
CARRIER	[REDACTED]
LOCATION	Rajasthan, India
CONNECTION TO TARGET	Comment on target's Facebook reel — likely associate or customer

4.2 Number B — investigation

Figure 4.3 — Truecaller result for Number B. All PII redacted.

NUMBER	[REDACTED — Number B]
OWNER NAME	[REDACTED]
LINKED EMAIL	[REDACTED]@gmail.com — confirmed via platform cross-reference
CARRIER	[REDACTED]
LOCATION	Rajasthan, India
OSINT VALUE	Email address recovered — enables further pivot via Holehe, GHunt, and breach database lookup

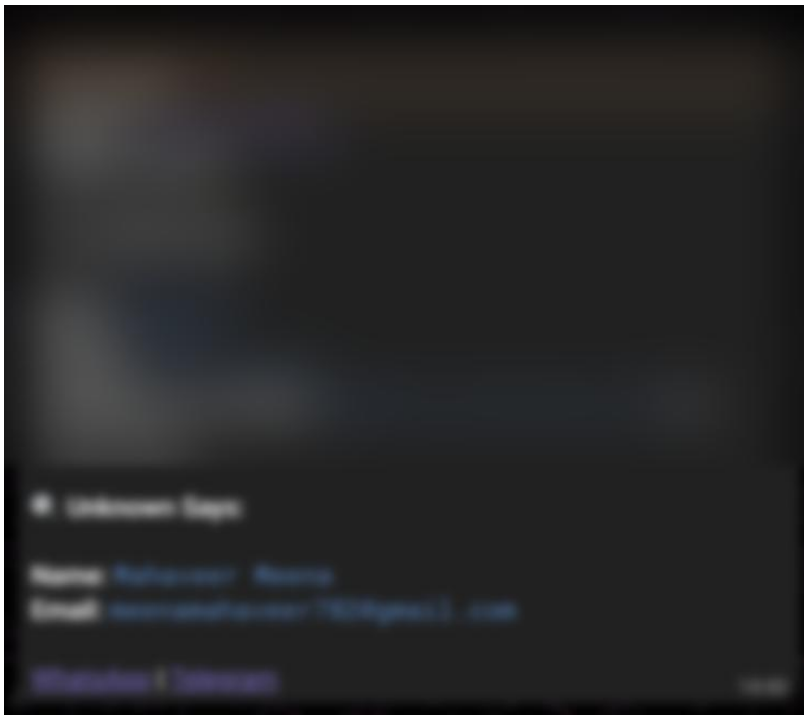

Figure 4.4 — Number B OSINT result showing owner name and linked email address. All PII redacted.

4.3 Number C — investigation

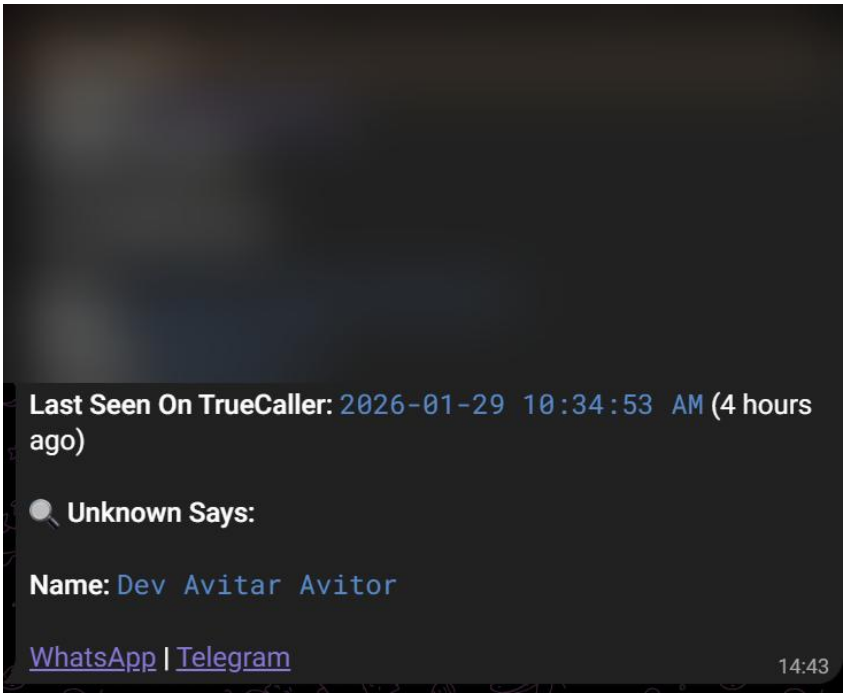

Figure 4.5 — Truecaller result for Number C. All PII redacted.

NUMBER	[REDACTED — Number C]
OWNER NAME	[REDACTED]
CARRIER	[REDACTED]
LOCATION	Rajasthan, India
CONNECTION TO TARGET	Third comment contributor on target's public Facebook content

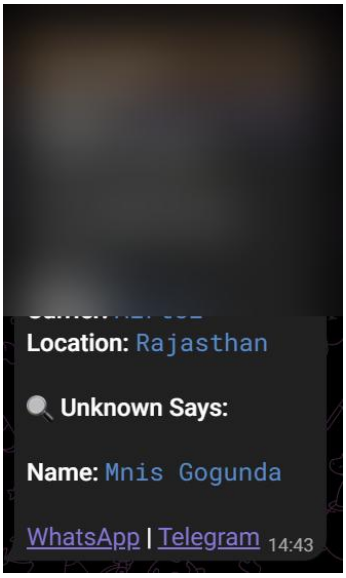

Figure 4.6 — Number A Truecaller result (mobile view). PII redacted.

4.4 Secondary number summary

#	NUMBER	OWNER	CARRIER	LOCATION	ADDITIONAL DATA
A	[REDACTED]	[REDACTED]	[REDACTED]	Rajasthan	—
B	[REDACTED]	[REDACTED]	[REDACTED]	Rajasthan	Gmail address recovered
C	[REDACTED]	[REDACTED]	[REDACTED]	Rajasthan	—

05 | IMAGE INTELLIGENCE — REVERSE IMAGE ANALYSIS

Objective: Apply reverse image search to Facebook profile and reel background imagery to identify matching content on other platforms — enabling geographic anchoring and cross-platform identity correlation.

Method: Screenshots of distinctive background elements from the target's Facebook reels were submitted to Google Reverse Image Search. The search was designed to find identical or similar images posted elsewhere, revealing associated accounts.

5.1 Reverse image search results

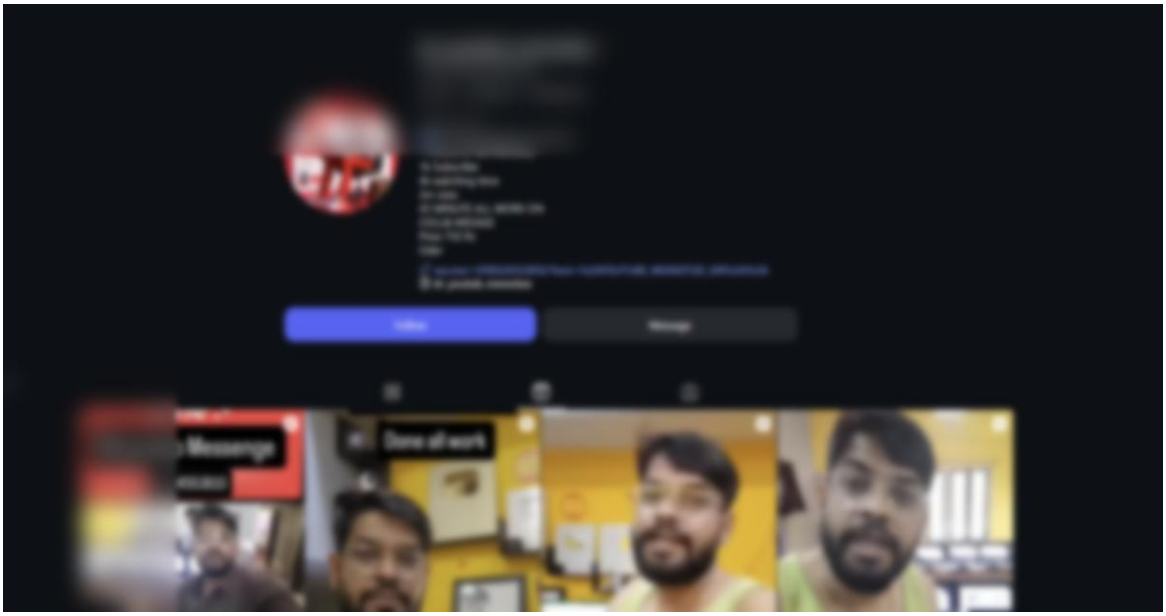

Figure 5.1 — Google Reverse Image Search Result 1: matching Instagram account with same background imagery. Profile handle redacted.

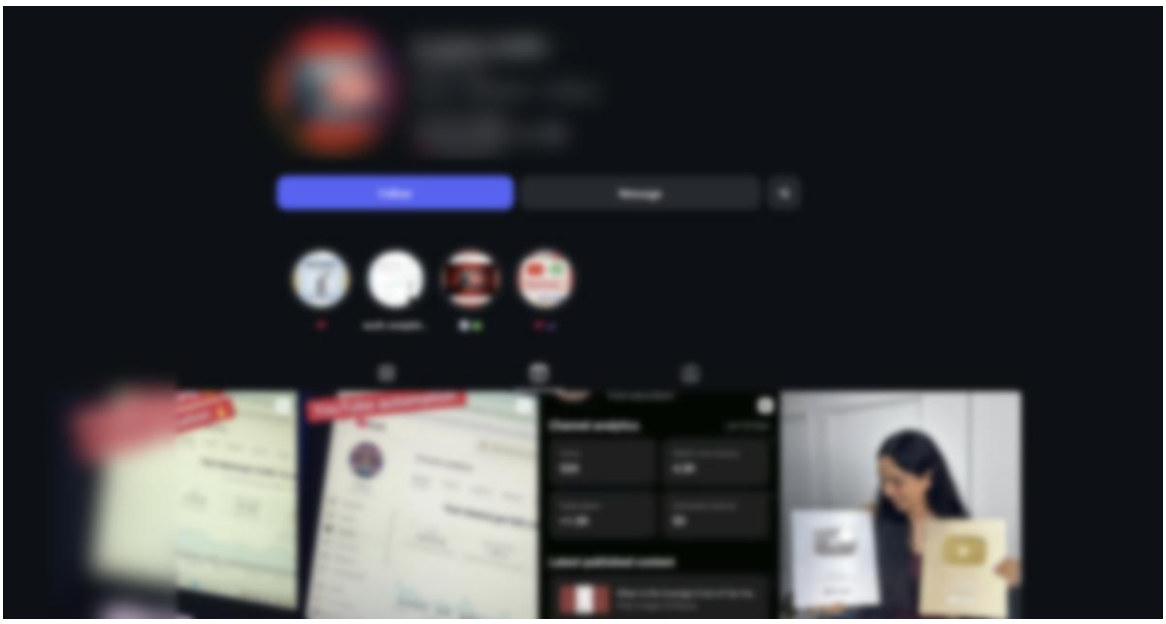

Figure 5.2 — Google Reverse Image Search Result 2: second Instagram account with identical background. Profile redacted.

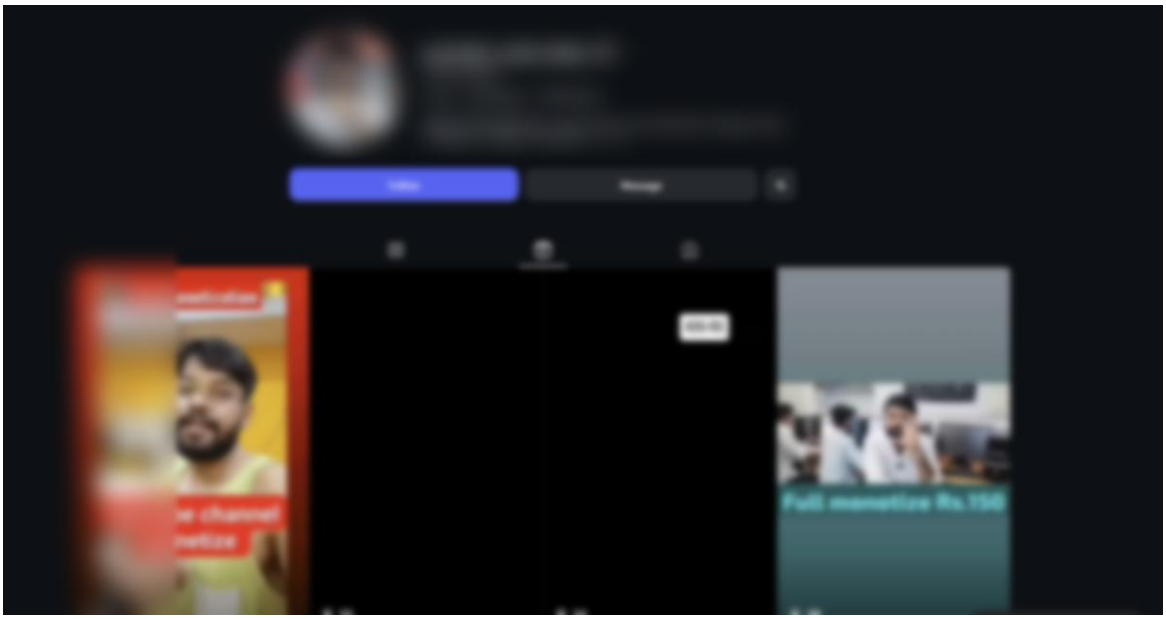

Figure 5.3 — Google Reverse Image Search Result 3: third matching Instagram profile. Handle redacted.

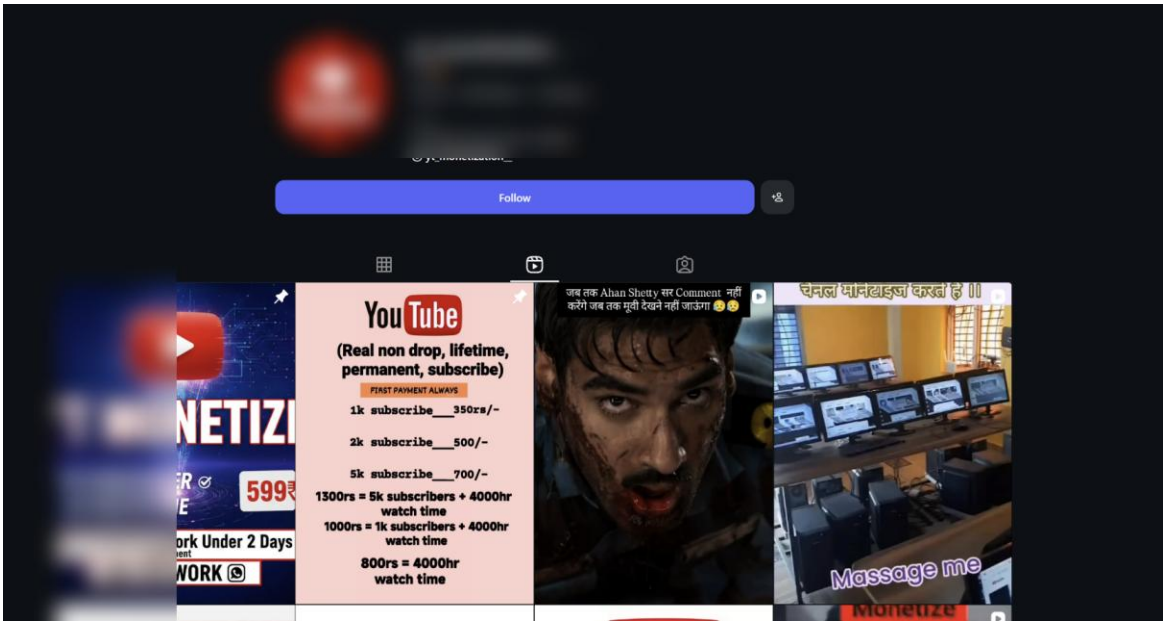

Figure 5.4 — Google Reverse Image Search Result 4: fourth Instagram account cluster match. Redacted.

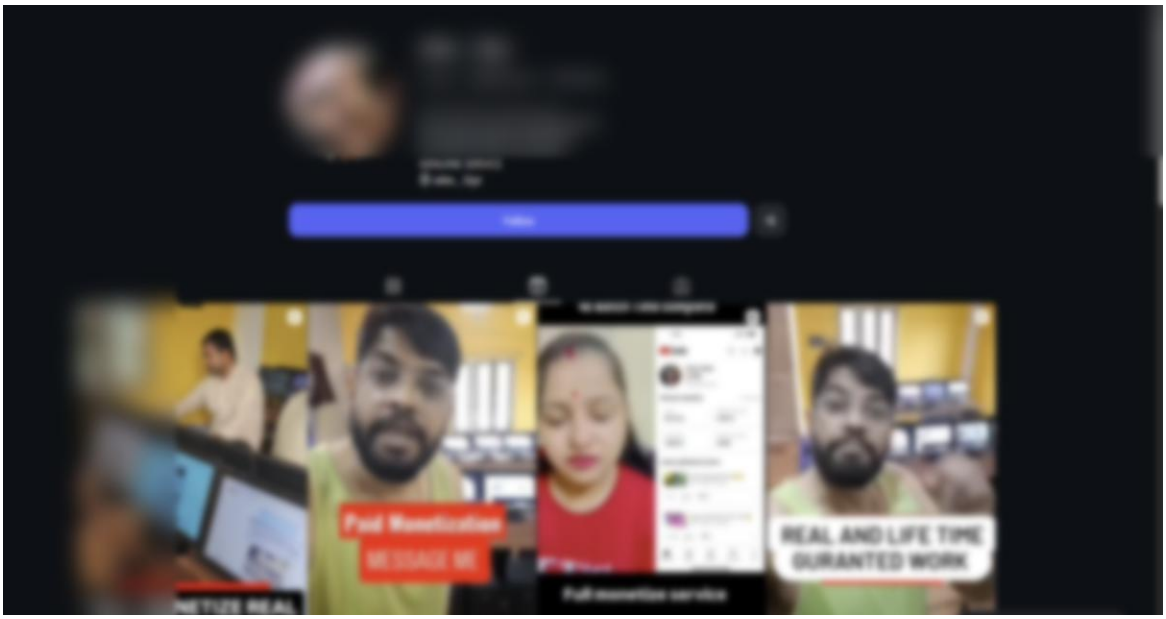

Figure 5.5 — Google Reverse Image Search Result 5: fifth matching account — 'Nitin' identity display name visible. Redacted.

5.2 IMINT findings

MATCH #	PLATFORM	HANDLE	SIGNIFICANCE
Match 1	Instagram	[REDACTED]	Same background as target Facebook reel — geographic cluster confirmed
Match 2	Instagram	[REDACTED]	Second account with identical backdrop — possible associate
Match 3	Instagram	[REDACTED]	Third cluster match — Rajasthan region visual elements consistent
Match 4	Instagram	[REDACTED]	Fourth match — same indoor/outdoor location pattern
Match 5	Instagram	[REDACTED] ('Nitin' visible)	CRITICAL: Display name 'Nitin' visible — suspected primary operator identity

IMINT ANALYST NOTE

The reverse image search successfully linked the Facebook target profile to a cluster of 5 Instagram accounts sharing identical or near-identical background imagery. This technique (visual background geolocation and cluster identification) is a standard IMINT tradecraft method for cross-platform identity attribution without direct account linkage. The appearance of the display name 'Nitin' in Match 5 is a significant lead — however, the investigator notes that this may be a pseudonym or alias and requires further corroboration before attribution. This account has been flagged as a Priority Investigation Target (PIT) for follow-up.

06 | ATTRIBUTION ASSESSMENT & FRAUD INDICATORS

6.1 Primary subject — attribution confidence

EVIDENCE ELEMENT	CONFIDENCE	ASSESSMENT
Target number → Truecaller name	HIGH	Direct attribution via crowd-sourced caller ID data
Target number → WhatsApp account	HIGH	WhatsApp active status confirmed via Truecaller
WhatsApp → Facebook profile	MEDIUM	Pivot via Meta account linkage — confirmed but indirect
Facebook → Instagram cluster (IMINT)	MEDIUM	5 matching accounts via reverse image search — geographic consistency
'Nitin' name → primary operator	LOW-MEDIUM	Name visible in one Instagram account — unverified; may be alias; further investigation required
YouTube service operation	MEDIUM	Facebook content explicitly promotes YouTube engagement services — consistent with the Truecaller 'YouTube service' attribution

6.2 Fraud indicators

Based on the investigation, the following fraud indicators were identified:

- **YouTube engagement fraud:** Target's Facebook content promotes paid YouTube service manipulation (subscribers, views, watch time) — a service that violates YouTube's Terms of Service and potentially constitutes consumer fraud when services are not delivered
- **Comment-based solicitation:** Multiple associates posting mobile numbers in public comments is consistent with decentralized fraud network structure — each number represents a potential sub-operator
- **Potential alias use:** The 'Nitin' Instagram account using the same background as the Facebook target suggests possible pseudonymous operation across platforms — a common OPSEC technique among fraud operators
- **Geographic clustering:** All 4 numbers trace to Rajasthan — suggesting a single organized operation rather than unrelated individuals

INVESTIGATOR'S OVERALL ASSESSMENT

The target mobile number is attributed to an individual operating a YouTube service promotion business via Facebook, using a network of associates who post contact numbers in public comments. The operation shows characteristics consistent with a coordinated digital services fraud scheme. The 'Nitin' Instagram lead requires follow-up investigation to confirm or rule out as primary operator. All findings are based on publicly available information and require law enforcement-grade verification before formal attribution.

07 | RECOMMENDED NEXT INVESTIGATION STEPS

The following pivots were identified but not executed in this investigation phase — recommended for follow-up:

#	ACTION	TOOL	EXPECTED YIELD
01	GHunt on recovered Gmail address (Number B)	GHunt, OSINT Industries	Google services linked to email — YouTube channel, Google Maps, Photos
02	Holehe check on recovered Gmail	Holehe (150+ platforms)	Platform registrations — Instagram, Twitter, LinkedIn, others
03	'Nitin' Instagram account deep investigation	Instagram OSINT, Maltego	Profile posts, location tags, linked accounts, follower network
04	Breach database search on recovered Gmail	Dehashed, IntelligenceX, HaveIBeenPwned	Leaked passwords, historical emails, prior registrations
05	Facebook content archiving	Archive.today, Wayback Machine	Preserve public content before potential deletion
06	Reverse username search on 'Nitin' variants	Sherlock, WhatsMyName	Other platforms using same or similar handle
07	Secondary number cross-check on Facebook	Facebook phone number search	Direct profile links for Numbers A, B, C

08 | ANALYST STATEMENT & METHODOLOGY

This report was produced by **Dharam Kathiriya** as an independent private OSINT investigation — not affiliated with any employer or institution. Conducted as part of continuous skill development in mobile number OSINT, phone pivot methodology, and social media intelligence. Investigation followed the standard OSINT framework: Define → Collect → Process → Analyze → Report → Review.
